

CS487 Individual Assessment

SHIQI LIU

Individual Contribution:

I did lots of research on this project. First of all, when we get to know the project is about smart parking, I draw a prototype and outline. Then, I did most of user analysis, functional requirement, testing strategy, and High-level Design report. Also, I talked with team frequency and we discussed each process.

Areas could Improve

Our team need to improve our final prototype. Because learning online, it is a bit difficult to share our ideas. Therefore, we just only divided each work and worked individually. That caused our final prototype is not able to combination.

Challenges:

In this project, our team met some problems and challenges, but most of problems we solved perfectly. For example, we could not meet in this special situation, but we messaged each other online. We also helped each other to solve their question, such as if our team member got confused in writing the test case reports, I would share class notes, searching result examples, and my option with this member. In this way, we could learn much more.
